Project Proposal: Vulnerability Prioritization Assistant

Project Information

Item	Details
Project Name	Vulnerability Prioritization Assistant
Project Web Page	https://mehmet-ali0.github.io/Vulnerability-Prioritization/
Team Members	Eylül Atik, İrem Akıl, Mehmet Ali Işık
Supervisor	Mert Burkay Çöteli
Jury Members	Gökçe Nur Yılmaz, Ayşe Yasemin Seydim

Project Description

Security scanners return hundreds or thousands of findings even for a small environment, but teams can fix only a few each week, and a CVSS score alone does not show which ones matter. A 9.8 on an unimportant test machine can outrank a 7.5 on an internet-facing web server that attackers are actively exploiting. The Vulnerability Prioritization Assistant turns raw scanner output into a short, ordered to-do list in which every item has a plain-language reason and a suggested fix.

The system converts vulnerability scanner output into one common format and enriches each finding with free public data: CISA KEV, EPSS and NVD. It then computes a transparent, tunable priority score from severity, evidence of exploitation and asset context such as internet exposure and data sensitivity. We will measure the resulting ranking against a baseline that uses CVSS alone.
